PRESENCE GUARD / WINDOWS & OBS STUDIO

Installation guide

Install the prebuilt Windows plugin and open its dock in OBS Studio.

01
Download
Actions artifact

→

02
Install
Plugin folder

→

03
Open
OBS dock

A little protection for your live scene

No compiler is required. This guide uses the prebuilt Windows x64 artifact from GitHub Actions.

Inside this guide

Find the artifact, extract both ZIPs, place the plugin folder in OBS, then verify the dock and log.

A practical guide by Emmanuel Suah

Presence Guard is a separate OBS plugin. This guide does not install ScreenForge or its mouse-click rings.

Get the Windows package

You need Windows 10 or 11 (64-bit), OBS Studio, a GitHub account to download artifacts, and a few minutes.

01 Open a successful build

Open this successful main-branch run. The Windows job in that run built the Presence Guard plugin.

02 Find Artifacts at the bottom

Scroll to **Artifacts** and download **presence-guard-0.1.0-windows-x64-6956a758a**. This is the OBS plugin, not the ScreenForge app.

03 Extract both ZIP files

Extract the downloaded Actions ZIP. Inside it, extract the second **presence-guard-0.1.0-windows-x64.zip**. The inner archive contains a **presence-guard** folder.

If the artifact has expired

Go to Actions, open a newer successful **main push run**, and download the **presence-guard-...-windows-x64-...** artifact at the bottom. Check that its Windows build succeeded. Artifacts expire; the DLL is not stored in the Code tab or a Release.

OBS 33 compatibility

The repository builds this plugin against OBS 31.1.1 headers. It has not been verified in OBS 33.x; if it does not load, check the OBS log and obtain a compatible build before relying on it.

Install and verify

01 Close OBS completely

Exit OBS, including any copy left running in the system tray.

02 Open the OBS plugin folder

In File Explorer, paste **%ProgramData%\obs-studio\plugins** into the address bar. Create the **plugins** folder if necessary. Windows may ask for administrator permission.

03 Copy the extracted folder

Move the entire extracted **presence-guard** folder into **plugins**. Keep the **bin** and **data** folders together; do not copy only the DLL.

```
C:\ProgramData\obs-studio\plugins\presence-guard\
  bin\64bit\presence-guard.dll
  data\locale\en-US.ini
```

04 Start OBS and open the dock

Restart OBS normally, not in Safe Mode. Choose **Docks > Presence Guard**. The dock may initially be floating or hidden.

05 Confirm it loaded

In OBS, choose **Help > Log Files > View Current Log** and search for **[presence-guard] loaded**. Then follow the separate usage guide.

Troubleshooting

01 The dock is missing

Check the folder layout on the previous page and restart OBS. Safe Mode skips third-party plugins. Check the current OBS log for **presence-guard** and any loading or dependency errors.

02 Windows blocked the download

If an extracted DLL has an **Unblock** option under Properties, select it and apply. Only use artifacts from the repository you trust.

03 The plugin will not load

A major OBS update can make an older plugin binary incompatible. This build was compiled against OBS 31.1.1; OBS 33 has not been verified. Keep the OBS log message when asking for help.

Uninstall

Close OBS and delete the **presence-guard** folder from **%ProgramData%\obs-studio\plugins**. Profile settings remain in OBS; the usage guide explains where they are stored.

Next: open the companion **Presence Guard usage guide** to configure the AFK and dead-air rules.
